## Gross Domestic Product by State: Second Quarter 2017

*Mining Led Growth Across Southwestern States in the Second Quarter*

Real gross domestic product (GDP) increased in 48 states and the District of Columbia in the second quarter of 2017, according to statistics on the geographic breakout of GDP released today by the U.S. Bureau of Economic Analysis. Real GDP by state growth in the second quarter ranged from 8.3 percent in North Dakota to -0.7 percent in Iowa (table 1).

Percent Change in Real GDP by State, 2017:Q1–2017:Q2, Seasonally Adjusted at Annual Rates

U.S. Bureau of Economic Analysis

Nationally, mining increased 28.6 percent and was the leading contributor to growth for the nation and in the three fastest-growing states of North Dakota, Wyoming and Texas in the second quarter (table 2). Mining contributed to growth in 49 states led by increases in oil and natural gas production.

By contrast, agriculture, forestry, fishing, and hunting decreased 10.6 percent and subtracted from growth in 25 states, including every state in the Plains region, which experienced high levels of crop production in 2016. This industry was the leading contributor to the decreases in real GDP in Iowa and South Dakota—the only two states to decrease in the second quarter.

### **Other Highlights**

In addition to mining; professional, scientific, and technical services; health care and social assistance; retail trade; and information services were the leading contributors to U.S. economic growth in the second quarter.

- Professional, scientific, and technical services increased 5.1 percent nationally—the seventeenth consecutive quarter of growth. This industry contributed to growth in every state and the District of Columbia. It includes activities such as legal, accounting, engineering, and computer services.
- Health care and social assistance increased 4.7 percent nationally. This industry contributed to growth in 49 states and the District of Columbia.
- Retail trade increased 5.6 percent, rebounding from a decrease in the first quarter, and contributed to growth in 49 states and the District of Columbia.
- Information services increased 7.0 percent in the second quarter and contributed to growth in 46 states and the District of Columbia.

### **Update of Gross Domestic Product by State**

In addition to the new 2017:Q2 statistics presented in this news release, BEA also revised quarterly GDP by state statistics for 2014:Q1 to 2017:Q1 and annual statistics for 2014 to 2016. Updates were made to incorporate source data that are more complete, including the September 2017 annual update to the State Personal Income Accounts, and to align the states with revised national estimates that were released with the November 2<sup>nd</sup> annual update to the Industry Economic Accounts and the July 2017 annual update to the National Income and Product Accounts.

Next release — January 24, 2018 at 8:30 A.M. EST for:  
Gross Domestic Product by State: Third Quarter of 2017

### Definitions

**Gross domestic product (GDP) by state** is the market value of goods and services produced by the labor and property located in a state. GDP by state is the state counterpart of the Nation's GDP, the Bureau's featured and most comprehensive measure of U.S. economic activity.

**Current-dollar statistics** are valued in the prices of the period when the transactions occurred—that is, at “market value.” Also referred to as “nominal GDP” or “current-price GDP.”

**Real values** are inflation-adjusted statistics—that is, these exclude the effects of price changes.

**Contributions to growth** are an industry's contribution to the state's overall percent change in real GDP. The contributions are additive and can be summed to the state's overall percent change.

### Statistical conventions

**Seasonal adjustment and annual rates.** Quarterly values are expressed at seasonally-adjusted annual rates (SAAR). For details, see the FAQ [“Why does BEA publish estimates at annual rates?”](#)

**Quantities and prices.** Quantities, or “real” measures, are expressed as index numbers with a specified reference year equal to 100 (currently 2009). Quantity indexes are calculated using a Fisher-chained weighted formula that incorporates weights from two adjacent periods (quarters for quarterly data and annuals for annual data). “Real” dollar series are calculated by multiplying the published quantity index by the current dollar value in the reference

year (2009) and then dividing by 100. Percent changes calculated from chained-dollar levels and quantity indexes are conceptually the same; any differences are due to rounding.

**Chained-dollar values** are not additive because the relative weights for a given period differ from those of the reference year.

Chained-dollar values of GDP by state are derived by applying national chain-type price indexes to the current dollar values of GDP by state for the 21 NAICS-based industry sectors. The chain-type index formula that is used in the national accounts is then used to calculate the values of total real GDP by state and real GDP by state at more aggregated industry levels. Real GDP by state may reflect a substantial volume of output that is sold to other states and countries. To the extent that a state's output is produced and sold in national markets at relatively uniform prices (or sold locally at national prices), real GDP by state captures the differences across states that reflect the relative differences in the mix of goods and services that the states produce. However, real GDP by state does not capture geographic differences in the prices of goods and services that are produced and sold locally.

**Relation of Gross Domestic Product (GDP) by State for the U.S. to GDP in the National Accounts.** An industry's GDP by state, or its value added, in practice, is calculated as the sum of incomes earned by labor and capital and the costs incurred in the production of goods and services. That is, it includes the wages and salaries that workers earn, the income earned by individual or joint entrepreneurs as well as by corporations, and business taxes such as sales, property, and Federal excise taxes—that count as a business expense.

GDP is calculated as the sum of what consumers, businesses, and government spend on final goods and services, plus investment and net foreign trade. In theory, incomes earned should equal what is spent, but due to different data sources, the measurement of income earned, usually referred to as gross domestic income (GDI), does not always equal the measurement of what is spent (GDP). The difference is referred to as the “statistical discrepancy.”

GDP by state for the U.S. differs from the GDP in the national income and product accounts (NIPAs) and thus from the Industry Economic Accounts' GDP by industry, because GDP by state for the U.S. excludes federal military and civilian activity located overseas, which cannot be attributed to a particular state.

(D) Data are suppressed to avoid disclosure of confidential information.

1. The U.S. values may differ from the values in the national income and product accounts (NIPAs) because the GDP by state accounts exclude federal military and civilian activity located overseas (because these activities cannot be attributed to a particular state).

Updated on 11/29/2017 to resolve minor rounding discrepancies between this table and the interactive table available through BEA.gov.
