

# NEWS RELEASE

EMBARGOED UNTIL RELEASE AT 8:30 A.M. EST, TUESDAY, NOVEMBER 24, 2015

BEA 15-55

GDP: Lisa Mataloni (202) 606-5304 [gdpniwd@bea.gov](mailto:gdpniwd@bea.gov)  
Profits: Kate Pinard (202) 606-5564 [cgniwd@bea.gov](mailto:cgniwd@bea.gov)  
News Media: Jeannine Aversa (202) 606-2649

## **GROSS DOMESTIC PRODUCT: THIRD QUARTER 2015 (SECOND ESTIMATE) CORPORATE PROFITS: THIRD QUARTER 2015 (PRELIMINARY ESTIMATE)**

**Real gross domestic product** -- the value of the goods and services produced by the nation's economy less the value of the goods and services used up in production, adjusted for price changes -- increased at an annual rate of 2.1 percent in the third quarter of 2015, according to the "second" estimate released by the Bureau of Economic Analysis. In the second quarter, real GDP increased 3.9 percent.

The GDP estimate released today is based on more complete source data than were available for the "advance" estimate issued last month. In the advance estimate, the increase in real GDP was 1.5 percent. With the second estimate for the third quarter, the decrease in private inventory investment was smaller than previously estimated (see "Revisions" on page 2).

The increase in real GDP in the third quarter primarily reflected positive contributions from personal consumption expenditures (PCE), nonresidential fixed investment, state and local government spending, residential fixed investment, and exports that were partly offset by a negative contribution from private inventory investment. Imports, which are a subtraction in the calculation of GDP, increased.

The deceleration in real GDP in the third quarter primarily reflected a downturn in private inventory investment and decelerations in exports, in PCE, in nonresidential fixed investment, in state and local government spending, and in residential fixed investment that were partly offset by a deceleration in imports.

**Real gross domestic income** (GDI) -- the value of the costs incurred and the incomes earned in the production of goods and services in the nation's economy -- increased 3.1 percent in the third quarter, compared with an increase of 2.2 percent (revised) in the second. The **average of real GDP and real GDI**, a supplemental measure of U.S. economic activity that equally weights GDP and GDI, increased 2.6 percent in the third quarter, compared with an increase of 3.0 percent (revised) in the second.

NOTE. Quarterly estimates are expressed at seasonally adjusted annual rates, unless otherwise specified. Percent changes are calculated from unrounded data and are annualized. "Real" estimates are in chained (2009) dollars. Price indexes are chain-type measures.

This news release is available on [BEA's Web site](#).

**Real gross domestic purchases** -- purchases by U.S. residents of goods and services wherever produced -- increased 2.2 percent in the third quarter, compared with an increase of 3.6 percent in the second.

The **price index for gross domestic purchases**, which measures prices paid by U.S. residents, increased 1.3 percent in the third quarter, compared with an increase of 1.5 percent in the second. Excluding food and energy prices, the price index for gross domestic purchases increased 1.3 percent, compared with an increase of 1.2 percent.

**Current-dollar GDP** -- the market value of the goods and services produced by the nation's economy less the value of the goods and services used up in production -- increased 3.4 percent, or \$151.0 billion, in the third quarter to a level of \$18,064.7 billion. In the second quarter, current-dollar GDP increased 6.1 percent, or \$264.4 billion.

## Revisions

The upward revision to the percent change in real GDP primarily reflected an upward revision to private inventory investment that was partly offset by downward revisions to PCE and to exports. For information on revisions, see "[The Revisions to GDP, GDI, and Their Major Components](#)."

	<u>Advance Estimate</u> (Percent change from preceding quarter)	<u>Second Estimate</u>
Real GDP	1.5	2.1
Current-dollar GDP	2.7	3.4
Real GDI	...	3.1
Average of Real GDP and Real GDI	...	2.6
Gross domestic purchases price index	1.3	1.3

For the second quarter of 2015, real GDI was revised up 1.5 percentage points, from 0.7 percent to 2.2 percent, primarily reflecting an upward revision to private wages and salaries based on newly available second-quarter tabulations from the BLS quarterly census of employment and wages.

## **Corporate Profits**

### **Profits from current production**

Profits from current production (corporate profits with inventory valuation adjustment (IVA) and capital consumption adjustment (CCAdj)) decreased \$22.7 billion in the third quarter, in contrast to an increase of \$70.4 billion in the second.

Profits of domestic financial corporations decreased \$8.5 billion in the third quarter, in contrast to an increase of \$34.6 billion in the second. Profits of domestic nonfinancial corporations increased \$15.8 billion, compared with an increase of \$24.3 billion. The rest-of-the-world component of profits decreased \$30.0 billion, in contrast to an increase of \$11.4 billion. This measure is calculated as the difference between receipts from the rest of the world and payments to the rest of the world. In the third quarter, receipts decreased \$7.2 billion, and payments increased \$22.7 billion.

Taxes on corporate income increased \$2.3 billion in the third quarter, compared with an increase of \$31.3 billion in the second. Profits after tax with IVA and CCAdj decreased \$25.0 billion, in contrast to an increase of \$39.2 billion.

Dividends increased \$27.1 billion in the third quarter, compared with an increase of \$1.2 billion in the second. Undistributed profits decreased \$52.2 billion, in contrast to an increase of \$38.0 billion. Net cash flow with IVA -- the internal funds available to corporations for investment -- decreased \$34.9 billion, in contrast to an increase of \$48.1 billion.

The IVA and CCAdj are adjustments that convert inventory withdrawals and depreciation of fixed assets reported on a tax-return, historical-cost basis to the current-cost economic measures used in the national income and product accounts. The IVA increased \$35.3 billion in the third quarter, in contrast to a decrease of \$78.7 billion in the second. The CCAdj decreased \$1.4 billion, in contrast to an increase of \$7.7 billion.

### **Gross value added of nonfinancial domestic corporate business**

Real gross value added of nonfinancial corporations increased in the third quarter. Unit profits from current production (profits per unit of real value added) were unchanged, reflecting an increase in unit prices and a decrease in unit nonlabor costs that were offset by an increase in unit labor costs.

BEA's national, international, regional, and industry estimates; the *Survey of Current Business*; and BEA news releases are available without charge on BEA's Web site at [www.bea.gov](http://www.bea.gov). <sup>r</sup> Revised. Revisions include changes to series affected by the incorporation of revised wage and salary estimates for the second quarter of 2015.

<sup>1</sup> Gross domestic income deflated by the implicit price deflator for gross domestic product.

See *Explanatory Note* at the end of the tables.

r Revised. Revisions include changes to series affected by the incorporation of revised wage and salary estimates for the second quarter of 2015.

1. Real gross domestic income is gross domestic product deflated by the implicit price deflator for gross domestic product.

Note: Users are cautioned that particularly for components that exhibit rapid change in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series. For accurate estimates of the contributions to percent changes in real gross domestic product, use table 2.

See *Explanatory Note* at the end of the tables.

<sup>r</sup> Revised

1. Food excludes personal consumption expenditures for purchased meals and beverages, which are classified in food services.

2. This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households. Percentage changes for these series are included in the addenda to table 8 and appendix table A.

See *Explanatory Note* at the end of the tables.

1. Gross domestic income deflated by the implicit price deflator for gross domestic product.

2. Food excludes personal consumption expenditures for purchased meals and beverages, which are classified in food services.

3. This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.

See *Explanatory Note* at the end of the tables.

19	Personal income excluding current transfer receipts, billions of chained (2009) dollars <sup>2</sup>	10,882.7	10,822.3	11,149.8	11,164.6	11,329.0	11,447.6	11,542.2	11,658.3	19	
20	Disposable personal income, billions of chained (2009) dollars <sup>2</sup>	11,688.3	11,523.1	11,836.3	11,863.1	11,998.7	12,114.7	12,193.6	12,312.2	20	

r Revised. Revisions include changes to series affected by the incorporation of revised wage and salary estimates for the second quarter of 2015.

1. Personal income is also equal to national income less corporate profits with inventory valuation and capital consumption adjustments, taxes on production and imports less subsidies, contributions for government social insurance, net interest and miscellaneous payments, business current transfer payments (net), and current surplus of government enterprises, plus personal income receipts on assets, and personal current transfer receipts.

2. The current-dollar measure is deflated by the implicit price deflator for personal consumption expenditures.

r Revised. Revisions include changes to series affected by the incorporation of revised wage and salary estimates for the second quarter of 2015.

1. The current-dollar gross value added is deflated using the gross value added chain-type price index for nonfinancial industries from the GDP-by-industry accounts. For periods when this price index is not available, the chain-type price index for GDP goods and structures is used.

2. Chained-dollar consumption of fixed capital of nonfinancial corporate business is calculated as the product of the chain-type quantity index and the 2009 current-dollar value of the corresponding series, divided by 100.

3. Chained-dollar net value added of nonfinancial corporate business is the difference between the gross value added and the consumption of fixed capital.

4. The deflator for gross value added of nonfinancial corporate business divided by 100.

NOTE. Estimates in this table are based on the 2002 North American Industry Classification System (NAICS).

<sup>r</sup> Revised.

1. For some components of final sales of computers, includes computer parts.

2. Farm output less intermediate goods and services purchased.

3. Consists of GDP less gross value added of farm, of households and institutions, and of general government.

4. Food excludes personal consumption expenditures for purchased meals and beverages, which are classified in food services.

5. This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.

See *Explanatory Note* at the end of the tables.

### **Explanatory Note: NIPA Measures of Quantities and Prices**

Current-dollar GDP is a measure of the market value of goods, services, and structures produced in the economy in a particular period. Changes in current-dollar GDP can be decomposed into quantity and price components. Quantities, or "real" measures, and prices are expressed as index numbers with the reference year -- at present, the year 2009 -- equal to 100.

Annual changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent years. (Quarterly changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent quarters; quarterly indexes are adjusted for consistency to the annual indexes before percent changes are calculated.) For example, the 2008-09 annual percent change in real GDP uses prices for 2008 and 2009 as weights, and the 2008-09 annual percent change in GDP prices uses quantities for 2008 and 2009 as weights. These annual changes are "chained" (multiplied) together to form time series of quantity and price indexes. Percent changes in Fisher indexes are not affected by the choice of reference year. (BEA also publishes a measure of the price level known as the implicit price deflator (IPD), which is calculated as the ratio of the current-dollar value to the corresponding chained-dollar value, multiplied by 100. The values of the IPD are very close to the values of the corresponding "chain-type" price index.)

Index numbers of quantity and price indexes for GDP and its major components are presented in this release in tables 5 and 6. Percent changes from the preceding period are presented in tables 1, 4, 7, 8, and appendix table A. Contributions by major components to the percent change in real GDP are presented in table 2.

Measures of real GDP and its major components are also presented in dollar-denominated form, designated "chained (2009) dollar estimates." For most series, these estimates, which are presented in table 3, are computed by multiplying the current-dollar value in 2009 by a corresponding quantity index number and then dividing by 100. For example, if a current-dollar GDP component equaled \$100 in 2009 and if real output for this component increased 10 percent in 2010, then the chained (2009) dollar value of this component in 2010 would be \$110 ( $= \$100 \times 110 / 100$ ). Percent changes calculated from chained-dollar estimates and from chain-type quantity indexes are the same; any differences will be small and due to rounding.

Chained-dollar values for the detailed GDP components will not necessarily sum to the chained-dollar estimate of GDP (or to any intermediate aggregate). This is because the relative prices used as weights for any period other than the reference year differ from those of the reference year. A measure of the extent of such differences is provided by a "residual" line, which indicates the difference between GDP (or other major aggregate) and the sum of the most detailed components in the table. For periods close to the reference year, when there usually has not been much change in the relative prices that are used as weights, the residuals tend to be small, and the chained-dollar estimates can be used to approximate the contributions to growth and to aggregate the detailed estimates. For periods further from the reference year, the residuals tend to be larger, and the chained-dollar estimates are less useful for analyses of contributions to growth. Thus, the contributions to percent change shown in table 2 provide a better measure of the composition of GDP growth. In particular, for components for which relative prices are changing rapidly, calculation of contributions using chained-dollar estimates may be misleading even just a few years from the reference year.
